

KUNDALI PROJECT – ROADMAP TO CLOSE THE GAP WITH ASTROSAGE-LEVEL PREDICTIONS

CONTEXT

Layer 1 (the chart math: planetary positions, ayanamsa, houses, nakshatra, dasha) is deterministic and you can get it arcsecond-accurate. That is NOT where AstroSage feels "phenomenal" and you feel "vague." The gap is almost entirely in Layer 2 – the prediction/rules engine. This file lists what to add, in the order to build it.

PART 1 – DATA / STRUCTURE YOU NEED TO ADD

1. Planetary Dignity Table

- For each of the 9 grahas: exaltation degree, debilitation degree, own signs, moolatrikona range, friend/enemy/neutral sign list.
- Add a function: `get_dignity(planet, sign, degree)` -> exalted / own / moolatrikona / friendly / neutral / enemy / debilitated
- Add combustion check: planet's angular distance from Sun < threshold (varies per planet) -> combust flag.

2. Shadbala (or a simplified strength score) – OPTIONAL but high value

- Full shadbala is 6 sub-strengths; for v1, a simplified weighted score using dignity + house placement + aspects is enough.
- Output: a 0-100 strength score per planet. This is what lets you later say "may" vs "will" instead of flat statements.

3. Aspect (Drishti) Engine

- Standard 7th house aspect for all planets, plus special aspects: Mars (4th, 8th), Jupiter (5th, 9th), Saturn (3rd, 10th).
- Function: `get_aspects(chart)` -> list of (planet, aspected_house, aspected_planet_if_any)

4. Yoga Detection Library

- Build as boolean-check functions, one yoga per function, e.g.:
`is_gajakesari_yoga(chart)`, `is_kemadruma_yoga(chart)`,
`is_raja_yoga(chart)`, `is_dhana_yoga(chart)`, `is_manglik(chart)`
- IMPORTANT: every dosha function must also check its own cancellation conditions (e.g. manglik cancellation if Mars is in own/exalted sign, or aspected by Jupiter, etc.) and return cancelled=True/False, not just triggered=True/False.

5. Divisional Chart (Varga) Calculators

- You likely already compute D1. Add at minimum:
 - D9 (Navamsa) – for marriage, spouse, general life strength
 - D10 (Dasamsa) – for career
 - D7 (Saptamsa) – for children, if you want that domain
- Each is pure arithmetic on longitude (documented ratios), reuse your existing longitude data, don't re-fetch from ephemeris.

6. Dasha-Transit Intersection Engine

- You already compute Vimshottari mahadasha/antardasha periods.
- Add: current transit positions (same ephemeris call, for today's date) -> compare transiting planets against natal chart houses/planets -> flag exact intersections (e.g. "transiting Saturn is currently aspecting natal Moon while you are in Mars-Ketu antardasha").
- This is the single feature that makes predictions feel "current" instead of generic/fixed.

7. Rules Corpus – restructure from flat to combinatorial

- Do NOT write rules like: {"condition": "Mars in 7th", "text": "..."}.
- Instead structure each rule as a combination of conditions that must ALL be true, e.g.:

```
{
  "domain": "marriage",
  "conditions": [
    {"planet": "Mars", "house": 7},
    {"planet": "Mars", "dignity_in": ["debilitated", "enemy"]},
    {"dosha": "manglik", "cancelled": false}
  ],
  "confidence_weight": "high",
  "text": "..."
```

- Build a small rule-matching engine that checks ALL conditions in a rule before it fires, and only surfaces rules where all conditions match. Rank fired rules by confidence_weight before stitching output.

8. Confidence / Hedging Language Layer

- Map strength score (from #2) to phrasing:
 - 80-100 -> direct statement ("this indicates...")
 - 50-79 -> moderate ("this suggests...", "there is a tendency toward...")
 - <50 -> soft ("this may contribute to...", "a minor influence toward...")
- This alone fixes a lot of the "over the top" feeling.

PART 1B – RAJ YOGA DETECTION (differentiator feature – most apps do this shallowly or not at all with proper sub-types)

Raj Yoga = combinations that grant power, status, success. Classical

(Parashari/BPHS) Raj Yoga is not one rule – it is a family of distinct patterns. Build each as its own checked function, don't lump into one:

1. Kendra-Trikona Raja Yoga (the core type)

- Lord of a kendra house (1,4,7,10) conjoins OR exchanges signs with (parivartana) OR mutually aspects the lord of a trikona house (1,5,9). Note: house 1 counts as both kendra and trikona, so lagna lord is always a key player.
- Must compute: `house_lord(house_num, chart)` -> which planet rules it based on lagna sign, then check conjunction/exchange/aspect between those two lords.
- Grade the yoga by dignity of both lords involved (exalted lords forming this = much stronger than debilitated lords forming it).

2. Viparita Raja Yoga

- Lords of 6th, 8th, and 12th houses (dusthana/malefic houses) placed IN each other's houses (i.e., 6th lord in 8th or 12th, 8th lord in 6th or 12th, 12th lord in 6th or 8th).
- Produces success through reversal/difficulty rather than direct placement – different tone of prediction text needed.

3. Neecha Bhanga Raja Yoga (debilitation-cancellation Raj Yoga)

- A debilitated planet's debilitation gets cancelled under specific classical conditions (e.g. the dispositor of its debilitation sign is in a kendra from lagna or Moon, or the debilitated planet's exaltation lord is in a kendra, or the debilitated planet is conjunct/aspected by its dispositor).
- When cancelled, the planet can give a very strong, specific type of rise-from-difficulty result – this is a favorite in classical texts and rarely implemented correctly in apps.

4. Dharma-Karmadhipati Yoga

- Special case of Kendra-Trikona RY specifically between 9th lord (dharma) and 10th lord (karma) – considered one of the strongest Raj Yogas when present, worth flagging separately even though it's technically a subtype of #1.

5. Raja Yoga strength/ranking

- Once multiple Raj Yogas are detected in one chart, rank them by: dignity of planets involved, whether they're in kendra/trikona themselves, whether dasha period matches the yoga's planets (a Raj Yoga only "activates" strongly during the dasha of its participating planets – this is important, don't just report it as always-on).
- This ranking + dasha-activation check is what makes your Raj Yoga output feel earned rather than a generic "you have raj yoga!" flag.

PART 1C — PRECISE LAGNA CHART OUTPUT (accuracy/display requirement)

"No vague things" — the chart itself must show exact data, not just sign placement:

1. For every planet AND the lagna, output degree-minute-second within its sign, not just the sign name.

Example: not "Mars in Scorpio" but "Mars: Scorpio 14°27'53\""

- pyswisseph gives you longitude as a float in degrees (0-360).

sign = int(longitude / 30)

degree_in_sign = longitude % 30

Convert degree_in_sign to D° M' S" format for display.

2. Show retrograde status explicitly per planet (Mercury/Venus/Mars/Jupiter/Saturn can retrograde; Sun/Moon never do; Rahu/Ketu are always retrograde by convention — state this rather than omitting).
3. Show nakshatra AND pada for every planet, not just the Moon (most apps only show nakshatra for Moon; showing it for all planets, especially lagna, is a differentiator and needed for later Raj Yoga and dasha-lord accuracy checks).
4. Show house lordship explicitly on the chart — i.e., label each house with which planet rules it, not just which planet sits in it. This is required input data for the Raj Yoga engine above, so build it as a reusable function: `get_house_lord(house_num, lagna_sign) -> planet`.
5. Cross-verify against a second source, not just AstroSage — use Jagannatha Hora (free, desktop, widely considered the most technically rigorous Vedic software) as your ground truth for degree-level precision, since it exposes raw values AstroSage sometimes rounds or hides in its consumer UI.

PART 1D — NOTE ON JAIMINI SYSTEM (optional future stretch, not required)

Parashari (BPHS) is the system this entire roadmap targets — it's the classical/mainstream approach and what AstroSage etc. use. A separate classical system called Jaimini (different karakas — Atmakaraka etc, different dasha type called Chara Dasha, sutra-based reasoning) exists and is rarely implemented well in consumer apps. Not required for parity with AstroSage, but genuinely rare — worth a "v2" flag if you want a second real differentiator after Raj Yoga.

PART 2 — BUILD ORDER (do this in sequence, not in parallel)

Step 1: Verify Layer 1 math against AstroSage/Jagannatha Hora for 2-3 known birth details (lagna degree, Moon nakshatra should match exactly). Do not proceed until this matches.

Step 1B: Build precise Lagna chart output (Part 1C) – degree/minute/second, retrograde flags, nakshatra+pada for all planets, house lordship function. Do this right after Step 1 since later features (Raj Yoga, yogas) all depend on house lordship data.

Step 2: Add Dignity Table + combustion check (Part 1, item 1).

Step 3: Add Aspect Engine (item 3).

Step 4: Pick ONE prediction domain only – recommend "marriage" or "career" since these have the most reference material online. Do not try to cover all life areas yet.

Step 5: For that one domain, build the Yoga/Dosha functions relevant to it (item 4), including cancellation logic. If domain allows, include Raj Yoga detection (Part 1B) here too since it's a strong differentiator – recommend prioritizing it early.

Step 6: Add the relevant Varga chart for that domain (D9 for marriage, D10 for career) (item 5).

Step 7: Restructure your rules as combinatorial JSON (item 7) – write 15-20 deep, multi-condition rules for this one domain rather than 100 shallow single-condition rules.

Step 8: Add the confidence/hedging layer (item 8) so output tone varies.

Step 9: Add Dasha-Transit intersection (item 6) so predictions can reference current timing, not just static placements.

Step 10: Test output against AstroSage's report for the same birth data in this one domain. Compare specificity and tone, not just correctness. Iterate on the rules corpus based on gaps.

Step 11: Only after one domain feels genuinely sharp, repeat steps 4-10 for a second domain (career, health, finance, etc.).

PART 3 – REFERENCE MATERIAL TO GATHER BEFORE WRITING RULES

- A classical yoga/dosha reference (e.g. content from BPHS – Brihat Parashara Hora Shastra – summaries, or a structured yoga list) to

source your rule conditions and cancellation logic from, rather than inventing conditions yourself.

- 3-5 sample AstroSage reports for known charts (yours, family, friends with consent) to reverse-engineer what conditions produced which statements – use these as your test/validation set for Step 10.

NOTE ON SCOPE

Full AstroSage-level depth across all life domains is a multi-year corpus-building effort. The build order above is designed to get ONE domain to feel genuinely sharp first, which is both a realistic project milestone and the best way to learn the pattern before scaling it out.
